

Project Design Phase
Proposed Solution

Date	28/06/2026
Roll Number	23A51A04K4
Project Name	Automated Network Request Management
Maximum Marks	4 Marks

Overview

The proposed solution is to develop an **Automated Network Request Management System** using **ServiceNow Flow Designer**. The system automates the complete lifecycle of a network request, from submission through approval to completion, reducing manual effort, improving efficiency, and providing real-time status updates.

Proposed Solution

1. **Service Catalog Request**

1. Users submit network-related requests through a Service Catalog item by providing details such as network type, issue description, location, and assignment group.

2. **Automatic Record Creation**

1. On submission, the system automatically creates a record in the **Network Database** table with an initial status of **New**.

3. **Email Notification**

1. An acknowledgment email is automatically sent to the requester confirming that the request has been received.

4. **Manager Approval Workflow**

1. The request is routed to the **Assignment Group Manager** for approval using Flow Designer's **Ask for Approval** action.

5. **Status Update**

1. If approved, the system:
 1. Assigns the request to the responsible manager.
 2. Updates the **Work Status** to **Work in Progress**.
 3. Sends an approval notification to the requester.

6. **Completion Approval**

1. After the assigned manager completes the work, a final approval confirms that the network request has been successfully completed.

7. Final Status Update

1. The system updates the **Work Status** to **Completed** and sends a completion email to the requester.

8. Rejection Handling

1. If the request is rejected at any approval stage:
 1. The **Work Status** is updated to **Rejected**.
 2. A rejection email is sent to the requester with the request status.

Benefits of the Proposed Solution

- Automates the complete network request process.
- Reduces manual intervention and paperwork.
- Ensures faster approval and request processing.
- Provides real-time email notifications at every stage.
- Improves transparency and request tracking.
- Maintains accurate records in the Network Database.
- Enhances productivity and service quality through workflow automation.
